Experiment No-18 : Database with NAME and DOB (Prolog)

Aim

To write a Prolog program to create a database with NAME and DOB (date of birth) and to retrieve information from it using queries.

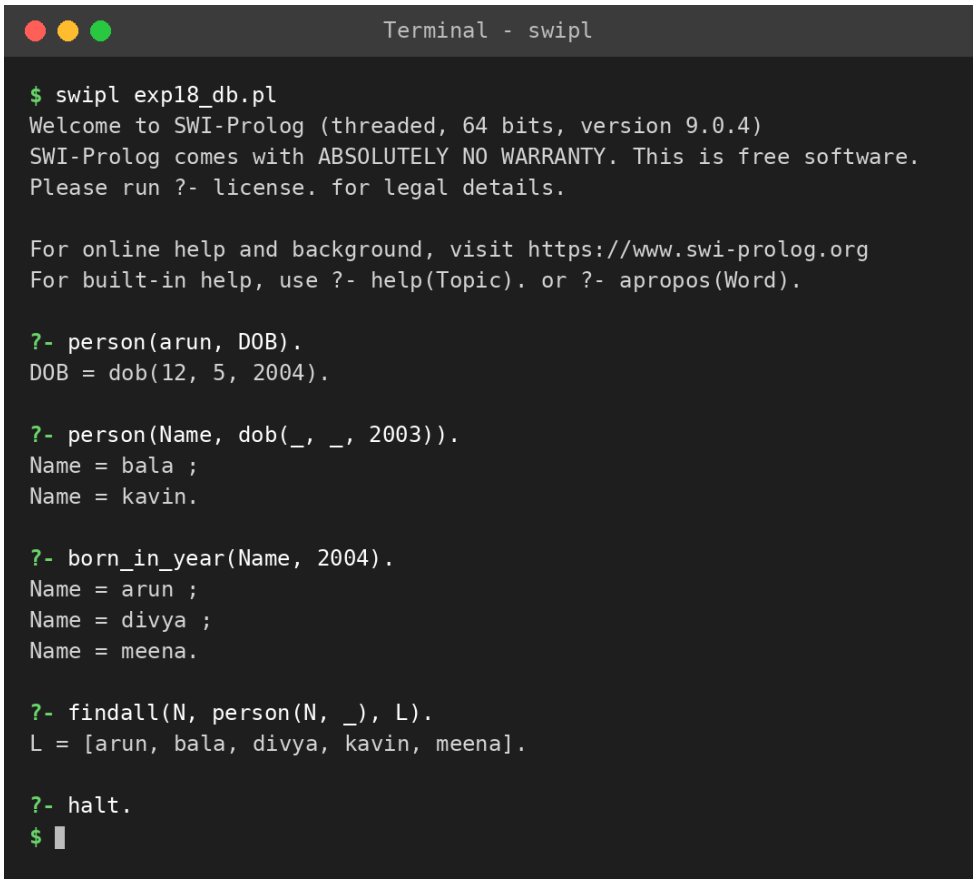

Programming Code:

```
% Database of NAME and DOB  -  person(Name, dob(Day, Month, Year))

person(arun,    dob(12, 5, 2004)).
person(bala,    dob(23, 9, 2003)).
person(divya,   dob(7, 1, 2004)).
person(kavin,   dob(30, 11, 2003)).
person(meena,   dob(18, 3, 2004)).

% Rule: find the name of persons born in a given year
born_in_year(Name, Year) :-
    person(Name, dob(_, _, Year)).
```

OUTPUT:

Expected Output

- The query person(arun, DOB). gives DOB = dob(12, 5, 2004).
- The query person(Name, dob(_, _, 2003)). gives Name = bala first. Pressing ; gives the next solution, Name = kavin.
- The query born_in_year(Name, 2004). gives arun, divya and meena one by one.
- The query findall(N, person(N, _), L). gives all the names in a list: L = [arun, bala, divya, kavin, meena].

Result

Thus, the Prolog program to create a database with NAME and DOB was executed successfully. The facts were queried to find a person's date of birth, to search by year and to list all names.
